"Active site amino acid sequence of the bovine O6-methylguanine-DNA methyltransferase.";

Nucleic Acids Res. 18:17-21(1990).

-! FUNCTION: Involved in the cellular defense against the biological effects of O6-methylguanine (O6-MeC) in DNA. Repairs alkylated guanine in DNA by stoichiometrically transferring the alkyl group at the O-6 position to a cysteine residue in the enzyme. This is a suicide reaction: the enzyme is irreversibly inactivated.

-! CATALYTIC ACTIVITY: DNA (containing 6-O-methylguanine) + protein L-cysteine = DNA (without 6-O-methylguanine) + protein S-methyl-L-
                                                                                                                                                                                                                                                                                                                                                                               01-DEC-1992 (Rel. 24, Created)

peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides, dimeric bicyclic peptides (comprising 1 linked monocyclic peptides) and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

Consequentiation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, postration or lymphangiogenesis.

Crecebrovascular accident, postrangioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive formone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a accolding to the period of the mammal of the mammal activity induced by VEGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

                                                                                                                                                                                                                                                                                                               characterised by angionesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, hemangiona, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphanic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by WEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a
                                                                                                whose 3-dimensional structure is modelled on the expose loop of human VBGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabet carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides of opeptides. The monocyclic peptides dimerric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis, newscapeling the cyclisation or lymphanglogenesis in a mammal with a condition the cyclisation or lymphanglogenesis in a mammal with a condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "the two conformation determining regions Cl and C2 which flank the protease recognition site peptide P are provided to position the two fluorophores within 100 angerroms of each other"
                                                                                   sequence represents a monomeric monocyclic peptide of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "peptide comprising a protease recognition site"

AAW82023-W82240 are peptides used in the construction of a fluorogenic composition which is used for the detection of protease activity in biological samples. The products can be used for the detection of conformation changes in nucleic acids, oligosaccharides, polysaccharides, proteins, peptides, lipids, phopholipids, glycolipids, glycolproteins, steroids or polymers. In addition, attachment of a hydrophobic group to a molecule can be used to enhance uptake by cells. The composition is composed of P = peptide comprising a protease binding site for the protease, F1, F2 peptides = fluorophores where F1 is attached to the amino acid and S1, S2 peptides = when present, are peptide spacers where S1, when present, is attached to the amino terminal acid, and S2, when present, is attached to the amino terminal acid, and S2, when
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protease binding site; protease; protease indicator; fluorescent signal; detection; protease activity.
                                                                                                                                                                                                                                                          New fluorogenic compositions - containing 2 fluorophores separated by a peptide comprising a protease binding site, used for detecting protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fluorogenic substrates for protease determination - having two closely

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a specific example of a fluorogenic substrate for detecting activity of a protease. The substrate agrees with the generic formula (S1)n-C1(F1)-P-C2(F2)-(S2)k in which a peptide P of 2-8 amino acids comprishing a recognition site for the protease is flanked by conformation determining regions (C1 and C2) of 1-3 amino acids. C1 and C2 are labelled by fluorophore groups (F1 and F2, respectively) positioned within 100 angstroms of each other. Additional peptide spacers of 1-50 amino acids (S1 and S2) may also be present (i.e. n and k = 0 or 1). Fluorogenic substrates corresponding to the generic formula are used to detect or localise proteases in biological specimens, esp. in frozen tissue sections or to monitor protease activity in stored reagents. Changes in protease activity are associated with e.g. arthritis, emphysema, thrombosis and cancer metastasis. (Updated on 25-MAR-2003 to correct PA field.)
                            /note= "the two conformation determining regions C1 and C2 which flank the protease recognition site peptide P are provided to position the two fluorophores within 100 angstroms of each other"
                                                                                                                                                  /note= "labelled by acceptor fluorophore F2 rhodamine X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protease activity, fluorphore; detection; fluorogenic; cellular uptake;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                       The present peptide contains a protease binding site. It is used to produce novel reagents whose fluorescence increases in the presence of particular proteases. These fluorescent signal at a visible wavelength when they are digested by a protease. The fluorogenic indicators (substrates) provide a high intensity fluorescent signal at a indicators have the containing a protease. The fluorogenic indicators have the containing a protease binding site e.g. AAW46520-53, AAW46550. Fl and F2 are fluorophores. Sl and S2 are peptide spacers e.g. AAW46550. Fl and F2 are fluorophores endown the composition which positions the fluorophores adjacent to each other with a separation of less than 100 Angstrom. When n is 1, S1 is joined to the terminal alpha -amino group of Cl by a peptide bond, and when k is 1, S2 is joined to the terminal carboxy group of C2 by a peptide bond. The protease indicators are used for detecting protease activity in a biological sample. The sample is contacted with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "the two conformation determining regions C1 and C2 which flank the protease recognition site peptide P are provided to position the two fluorophores within 100 angstroms of each other"

```
The present sequence is a specific example of a fluorogenic substrate for detecting activity of a protease. The substrate agrees with the generic formula ($11)n-CI(FI)-FCZ(FZ)-($2)k in which a peptide P of 2-8 amino acids comprising a recognition site for the protease is flanked by conformation determining regions (C1 and C2) of 1-3 amino acids. C1 and positioned within 100 angstroms of each other. Additional peptide spacers of 1-50 amino acids (S1 and S2) may also be present (i.e. n and k = 0 or 1). Fluorogenic substrates corresponding to the generic formula are used to detect or localise proteases in biological specimens, esp. in frozen tissue sections or to monitor protease activity in stored reagents. Changes in protease activity are associated with e.g. arthritis, emphysema, thrombosis and cancer metastasis. (Updated on 25-MAR-2003 to

The present peptide contains a protease binding site. It is used to produce novel reagents whose fluorescence increases in the presence of particular proteases. These fluorogenic proteases indicators (substrates) provide a high intensity fluorescent signal at a visible wavelength when they are digested by a protease. The fluorogenic indicators have the ceneral formula: F1-C1-P-C2-F2 | [(S1)n (S2)k where: P is a peptide containing a protease binding site e.g. AAW46520-53, AAW46550. F1 and F2 are peptide spacers e.g. AAW46550. F1 and F2 are peptide spacers e.g. AAW46550. F1 and F2 care fluorophores. S1 and S2 are peptide spacers e.g. AAW46550. F1 and F2 care fluorophores adjacent to care conformation-determining regions that introduce a cach other with a separation of less than 100 Angstrom. When n is 1, S1 is joined to the terminal alpha -amino group of C1 by a peptide bond, and peptide bond. The protease indicators are used for detecting protease activity in a biological sample. The sample is contacted with the indicator and any change in fluorescence is detected, an increase in

  AAW82023-W82240 are peptides used in the construction of a fluorogenic composition which is used for the detection of protease activity in biological samples. The products can be used for the detection of conformation changes in nucleic acids, oligosaccharides, proteins, peptides, lipids, phopholipids, glycolipids, glycoproteins, steroids or polymere. In addition, attachment of a hydrophobic group to amolecule can be used to enhance uptake by cells. The composition is composed of P = peptide comprising a protease binding site for the protease, F1, F2 peptides = fluorophores where F1 is attached to the amino acid and F2 is attached to the carboxyl terminal amino acid and S1, S2 peptides = when present, are peptide spacers where samino acid and S1, S2 peptides = when present, are peptide spacers where present, is attached to the amino terminal acid, and S2, when present, is attached to the amino terminal acid, and S2, when

  /note= "F2, where F2 is an acceptor fluorophore rhodamine K acetamide (R492)"
  used for the detection of protease activity. This can be useful as an indicator of viral infection, cancer metastasis, haemophilia, emphysema, thrombosis and arthritis. The fluorogenic compositions comprise a peptide, a peptide spacer and a donor and an acceptor fluorophore. The peptide is cleaved by a protease and the fluorophores can then be detected. The present sequence is one of the peptides described in the exemplification of the invention
  New fluorogenic compositions whose fluorescence level increases in the presence of active proteases, useful for detecting and localizing protease activity in biological samples, particularly in frozen tissue

The invention relates to a fluorogenic composition (I) for detecting the activity of a protease. (I) is useful for detecting the activity of a protease, which involves contacting the protease with involves contacting the protease with (I), where the activity of protease is detected in a histological section, cell culture or tissue section. The cell suspension is derived from the biological sample chosen from tissue, blood, urine, lymph or biological protease activity is detected by fluorescence microglate reader, absorption microplate reader, fluorometry, absorption microplate reader, fluorescent microplate cader. (I) is useful for delivering a molecule into a cell, and for screening a test agent for the ability to modulate the activity of the protease. (I) is useful for detection and localisation of protease activity in biological samples. (I) also acts as a protease inhibitor; thus useful as procease inhibitors. (I) enables detection of the protease activity, and provides a high intensity fluorescent signal at a visible activity and activity and provides a high intensity fluorescent are visible.

Compositions for enhancing uptake of e.g. drugs or DNA across a cell membrane, comprise membrane translocating peptides having specific amino acid sequences or a derivative, fragment, motif, analog or peptidomimetic
  The sequence represents a human membrane translocated peptide (MTLP). MTLPs and their related fragments, motifs, derivatives and analogues are used for enhancing uptake of a pharmaceutically active agent into a cell; into or out of an intracellular compartment and across a cell layer (for example, an epithelial cell layer lining the gastrointestinal tract), either directly or from a pharmaceutically active agent loaded particle, into the circulatory system of an animal. This method is useful for intracellular gene delivery, as a rapid screening method for the identification of MTLPs which retain the functional activity of a MTLP and characterising the properties of a MTLP, for diagnosis of a pathological disorder (by administration of a MTLP-active particle complex comprising a diagnostic agent) and for preventing or treating a pathological disorder.

   The invention relates to an isolated peptide of 100 amino acids or less in size useful for targeting delivery to an organ or tissue, particularly disease, alsease, e.g. cancer, arthritis, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial infection, viral infection, cardiovascular disease or degenerative disease. The peptide is also useful for inducing apoptosis, particularly to a subject with inflammation or macular degeneration. Furthermore, the peptide is useful for diagnosing the disease cited above. Targeting peptides of the invention can also be used to deliver an agent to a foetus, by attaching a peptide to the agent and administering the peptide to a pregnant subject. Sequences ABG60326-ABG60574 represent selective targeting

  The present invention describes a method for treating obesity or a selective for adipose tissue; (a) obtaining a targeting peptide selective for adipose tissue; (b) attaching the peptide to a therapeutic agent to form a complex; (c) administering the complex to a subject; and dipose targeting peptides not enorectic and antilipaemic activities, and can be used in peptides have anorectic and antilipaemic activities, and can be used in peptides not gene therapy. The method is used for treating obesity or a lipodystropathy that is related to infection with human immundeficiency virus (HIV). The peptides used in the method can also be used for targeting delivery to an organ or tissue, such as placental delivery. A receptor that binds to a placenta targeting peptide is used to screen compounds for teratogenic activity. ABR56806 to ABR56827 and ACC79106 to ACC79111 represent sequences used in the exemplification of the present invention

The invention relates to a method of detecting (MI) cancer in a patient by: (1) contacting a biological sample from the patient with an agent that binds to any of three polypoptides given in the specification; (ii) detecting in a sample an amount of the peptide that binds to the binding agent; and (iii) comparing the amount of polypoptide present in the patient's sample to a predetermined cutoff value. The specification also discloses a separate method for detecting (M2) cancer in a patient by a method similar to M1, except that the detection agent is an oligonucleotide that binds to any of three polymucleotides given in the specification. M1 and M2 are useful for detecting the presence of cancer in a patient, especially chronic lymphocytic leukemia. The applicants in a patient, especially chronic lymphocytic leukemia. The applicants types of hematological malignancies. This sequence corresponds to a peptide used in the method of the invention.
   Detecting cancer in a patient comprises contacting a biological sample from the patient with a binding agent that binds to a cancer-associated polypeptide and comparing the amount of polypeptide to a predetermined

   The invention relates to a method of detecting (M1) cancer in a patient by: (i) contacting a biological sample from the patient with an agent that binds to any of three polypeptides given in the specification; (ii) detecting in a sample an amount of the peptide that binds to the binding agent; and (iii) comparing the amount of polypeptide present in the patient's sample to a predetermined cutoff value. The specification also discloses a separate method for detecting (M2) cancer in a patient by a method similar to M1, except that the detection agent is an oligonucleotide that binds to any of three polymucleotides given in the specification. M1 and M2 are useful for detecting the presence of cancer in a patient, especially chronic lymphocytic leukemia. The applicants have identified specific human polypeptides overexpressed in one or more
have identified specific human polypeptides overexpressed in one or more types of hematological malignancies. This sequence corresponds to a peptide used in the method of the invention.
  Detecting cancer in a patient comprises contacting a biological sample from the patient with a binding agent that binds to a cancer-associated polypeptide and comparing the amount of polypeptide to a predetermined cutoff value:

Alitalo K., Achen M.G.; Secondarial growth factor-D involves protecolytic processing which generates non-covalent homodimers."; L. J. Biol. Chem. 274:32127-32136(1999).

-!- FUNCTION: Growth factor active in angiogenesis, lymphangiogenesis and endothelial cell growth, stimulating their proliferation and migration and also has effects on the permeability of blood vessels. May function in the formation of the venous and lymphatic vascular systems during embryogenesis, and also in the maintenance of differentiated lymphatic endothelium in adults. Binds and activates VEGFR-2 (FIkl) and VEGFR-3 (FIt4) receptors.

-!- SUBMITT: Homodimer; non-covalent and antiparallel.

-!- SUBMITT: Homodimer; non-covalent and antiparallel.

-!- TISSUE SPECIFICITY: Highly expressed in lung, heart, small intestine and fetal lung, and at lower levels in skeletal muscle,

  colon, and pancreas.

PTW: Undergoes a complex proteolytic maturation which generates a PTW: Undergoes a complex processed secreted forms with increased activity toward VEGFR-3 and VEGFR-2. VEGF-D first form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed bound by non-covalent interactions.

SIMILARITY: Belongs to the PDGF/VEGF growth factor family.

  ö
   PTM: Undergoes a complex proteolytic maturation which generates a variety of processed secreted forms with increased activity toward VEGFR-3 and VEGFR-2. VEGF-D first form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed VEGF-D is composed mostly of two VEGF homology domains (VHDs) bound by non-covalent interactions (By similarity). SIMILARITY: Belongs to the PDGF/VEGF growth factor family.

  olon, and pancreas.

PTM: Undergoes a complex proteolytic maturation which generates a PTM: Undergoes a complex proteolytic maturation which generates a variety of processed forms with increased activity toward VEGRR-3 and VEGRR-2. VEGR-D first form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed VEGR-D is composed mostly of two VEGR homology domains (VHDs) bound by non-covalent interactions.

SIMILARITY: Belongs to the PDGF/VEGF growth factor family.

Novel compositions comprising antibodies reactive to vascular endothelial growth factor-D, useful for treating, e.g. angiogenesis, lymphogiogenesis and neovascularization disorders.
   (vascular enothelial growth factor D), lacking both the N- and C-terminal regions. The invention relates to a monoclonal antibody, or fragments thereof, which is specifically reactive with the truncated human VEGF-D, and methods of preparing the antibody. The antibody of the invention interferes with the binding of VEGF-D to the VEGF receptors VEGFR-2 and VEGFR-3, but does not interfere with the binding of VEGF to these receptors and additionally is not reactive with VEGF-C. The antibody may be used to treat disorders associated with vascular permeability, endothelial cell proliferation, angiogenesis, lymphangiogenesis, neovascularisation and endothelial cell differentiation, especially cancer, diabetic retinopathy, psoriasis, and attropathies. The antibody may also be used to treat fluid accumulation in the heart and/or lung via medulation of vascular permeability. It may additionally be used to detect VEGF-D and may be used to image lymphatic

New endothelial growth factor polypeptide and polynucleotides, useful for diagnosing, preventing, and treating cancer and other conditions or diseases involving angiogenesis and cell proliferation.
  This invention describes a novel human endothelial growth factor polypeptide which has cytostatic activity. The polypeptide and its encoding polypucleotide are useful in the diagnosis, prevention, and treatment of cancer and other conditions or diseases involving angiogenesis and cell proliferation. NVR may also be used to promote revascularisation following traumatic amputation and surgical reconstruction or added to a tissue culture to promote vasculagenesis in tissues for autologous or heterologous transplant. Antagonists or inhibitors of NVR may be used to suppress or prevent angiogenesis and inhibitors of NVR may development of cancers such as cancer of the brain, breast, intestine, kidney, lung, ovary, pancreas, prostate or uterus. The products of the invention can be used for gene therapy. This sequence represents the human NVR protein described in the disclosure of

  This invention describes a novel single-chain dimeric polypeptide which binds to extracellular ligand-binding domain of vascular endothelial growth factor (VEGF) type 3 receptor (KER) or VEGF type 3 receptor (Filters). The polypeptide of the invention comprises two receptor-binding sites of which one is capable of binding to a ligand-binding domain of the receptor, and at least one monomer of the dimeric polypeptide is derived from VEGF. Or VEGF-D, where the polypeptide of the invention is useful for preparing a medicament for preventing or treating a disease or condition involving increased signal transduction from, or an increased activation of a VEGF-D (Type 2 or type 3 receptor e.g. for inhibiting angiogenesis or type 2 or type 3 receptor e.g. for inhibiting angiogenesis or law bandished and used in the construction of a VEGF-D monomer which can be modified and used in the construction of a VEGF-D monomer which can be modified in the disclosure of the invention
  ö
  Novel single-chain dimeric polypeptide for inhibiting angiogenesis, binds to extracellular ligand-binding domain of vascular endothelial growth factor type 2/type 3 receptor but does not activate the receptor.

  The sequence is that of human breast vascular endothelial growth factor D (VEGF-D). VEGF-D can be used for e.g. acceleration of angiogenesis in wound healing, tissue or organ transplantation, or to establish collateral circulation in tissue infarction or arterial stenosis, such as coronary artery disease, and inhibition of angiogenesis in the treatment of coronary artery disease, and inhibition of angiogenesis in the treatment of carcier or of diabetic retinopathy. It can also be used in the treatment of lung disorders to improve blood circulation in the lung and/or gaseous exchange between the lungs and the blood stream or to improve blood circulation to the heart and 02 gas permeability in cases of cardiac insufficiency, to improve blood flow and gaseous exchange in chronic obstructive airway disease, or to treat malabsorptive syndromes of in the intestinal tract. Quantitation of VEGF-D in cancer blopsy specimens may be useful as an indicator of future metastatic risk. Antagonists can be used for treating e.g. conditions such as congestive from increases in vascular permeability. The products can also be used for detection and diagnosis
   New isolated vascular endothelial growth factor-D - used to develop products for use in e.g. modifying angiogenesis or treating lung, heart

This sequence is vascular endothelial growth factor-D (WEGF-D), which is an angiogenic protein of the invention. The angiogenic proteins and the can angiogenic protein of the invention. The angiogenic proteins and the list are used to prevent, treat or ameliorate disease and to detect diseases, or susceptibility, by detecting mutations or the presence or amount of angiogenic protein expression. Particularly they are used to stimulate wound healing, growth of damaged bone and tissue, and for repair of vascular tissue, especially peripheral arterial disease, critical limb ischaemia or coronary disease. Antagonists of the sequences are used to inhibit angiogenesis in tumours and to treat conflammation (where associated with increased vascular permeability), diabetic retinopathy, rheumatoid arthritis or psoriasis. Agonists are also used to identify specific binding agents (potential therapeutic agents) and to raise antibodies. The antibodies are useful as therapeutic agents) and to raise antibodies. The antibodies are useful as therapeutic conflammanotyping of cells, e.g. for detection minimal residual disease or in vivo or in vitro diagnosis (including imaging) or for therapy confirmation of cells, e.g. for detecting minimal residual disease or immunotyping of cells, e.g. for detecting minimal residual disease or haematopoietic progenitor/stem cells. It is also contemplated that the conservation end of the nervous system conservation of the nervous system

The present sequence represents a human avegf2 growth factor encoded by the zvegf2 cDNA which was isolated from a human heart cDNA library.

CC treezvegf2 protein in a dimeric form acts as a mitogen for fibrohasts or smooth muscle cells. zvegf2 is claimed to be useful for stimulating the research tissue. zvegf2 is particularly claimed to be useful for the treatment of cilsue. zvegf2 is particularly claimed to be useful for the treatment of cill-thickness skin wounds, including venous stasis ulcers and diabetic ulcers. The zvegf2 promoting revascularisation of the healing tissue.

CC tissue adhesives for promoting revascularisation of the healing tissue.

Antagonists against zvegf2 can be used to block its mitogenic.

Chemotactic and angiogenic effects. The antagonists may therefore be useful for reducing growth of solid tumours by inhibiting nevascularisation of the developing tumour or by directly blocking tumour cell growth, in the treatment of diabetic retinopathy, psoriasis, arthritis, and scleroderma
   New isolated vascular endothelial growth factor - used to develop products for treating e.g. wounds, burns, myocardial infarction, tumours, psoriasis, arthritis, restenosis or organ transplants.

The sequence is that of human lung vascular endothelial growth factor D (VEGF-D). VEGF-D can be used for e.g. acceleration of angiogenesis in wound healing, tissue or organ transplantation, or to establish coronary artery disease, and inhibition of angiogenesis in the treatment of cancer or of diabetic retinopathy. It can also be used in the creatment of lung disorders to improve blood circulation in the lung and/or gaseous exchange between the lungs and the blood stream or to improve blood circulation to the heart and O2 gas permeability in cases of cardiac insufficiency, to improve blood flow and gaseous exchange in chronic obstructive airway disease, or to treat malabsorptive syndromes in the intestinal tract. Quantitation of VEGF-D in cancer biopsy specimens may be useful as an indicator of future metastatic risk.

Antagonists can be used for treating e.g. conditions such as congestive heart failure, involving accumulations of fluid in the lung resulting from increases in vascular permeability. The products can also be used

This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has cultimerary, cytostatic, antirheumatic, antiparintic, antipariation and antidiabetic activity and acts as an angiogenesis and vascularization captured. An antisense molecule of the invention is useful for treating crequiator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ at the samplect. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human VEGD protein used to illustrate the method of the invention

The patent discloses a method to treat neoplastic disease characterised by expression of fms-like tyrosine kinase 4 (Flt4) receptor (also referred as vascular endothelial growth factor receptor-3, VEGFR-3) in endothelial cells of blood vessels adjacent to malignant neoplasm. The method involves administering a compound that inhibits binding of a ligand to Flt4 thereby inhibiting Flt4 mediated proliferation of vascular endothelial cells. The compound is useful for treating neoplastic disease such as breast carcinomas, squamous cell carcinomas, lymphomas, melanomas and sarcomas. Flt4 receptor tyrosine kinase binding compounds can be used for manufacturing medicament useful for diagnostic screening, imaging and the control of malignancies characterised by Flt4-expressing blood cells.
   The FLEE gene maps to chromosomal region 5435 and is expressed as 5.8 kb and 4.5 kb mRNAs which differ in their 3' sequences and are differentially expressed in HEL and DAMI cell lines. Fit belongs to a subfamily of class III receptor tyrosine kinases (RTKS). It is used as a target for tumour imaging and anti-tumour therapy. The present sequence is a human prepro-vascular endothelial growth factor D (VEGF-D), a specific example of Flet binding compound. A recombinantly matured VEGF-D lacking residues 1-92 and 202-354 retains the ability to activate VEGFR-2 and VEGFR-3 receptors and associate as non-covalently linked dimers
   Human; receptor tyrosine kinase; RTK; Flt4; fms-like tyrosine kinase 4; VBGRR-3; vascular endothelial growth factor receptor-3; chromosome 5q35; cytostatic; tumour imaging; anti-tumour therapy; treatment; diagnosis; neoplastic disease; lymphoma; carcinoma; breast; squamous cell; melanoma; sarcoma; malignancy; VBGF-D; vascular endothelial growth factor D.
  Treating neoplastic diseases such as lymphoma, carcinomas, melanomas and sarcomas, involves administering a compound capable of inhibiting binding of ligand proteins to fms-like tyrosine kinase-1 receptor.
Human prepro-vascular endothelial growth factor D.

peptides top tragament toum an exposed top of a glowin factor processing the peptide by oxidising the oxidising the oxidising the oxidising the oxidising the oxidising the oxidising the oxidising the oxidising the oxidising 2 linked monocyclic peptides, and a cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis.

The condition is diabetic retinopathy, postrians arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced meovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid communitation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF. Or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and

The sequence represents a monometric monocyclic pepture or the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monometric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior peptides) and a cyclic peptide with at least one amino acid deleted prior cocyclisation are used to interfere with angiogenesis.

CC cyclisation are used to interfere with angiogenesis, necowacularisation or lymphangiogenesis, necowacularisation or lymphangiogenesis, necowacularisation or lymphangiogenesis, necowacular condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or crauma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascularisation of the liver, excessive created angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability or brain. The peptides are used to image blood vessels and lymphatic cor brain. The peptides are used to image blood vessels and lymphatic virth at least one biological activity induced by VEGF. VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat and the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CV Whose 3-dimensional structure is modelled on the expose loop of human configuration of producing a monomeric monocyclic peptide by a measuring beta-configuration distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior conformation are used to interfere with anglogenesis.

CC cyclisation are used to interfere with anglogenesis.

CC condition is diabetic retinopathy, psoriasis, atthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold characterised by anglogenesis, neovascularisation or lymphangiogenesis.

CC condition is diabetic retinopathy, psoriasis, atthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold corramn, substance-induced neovascularisation of the liver, excessive corranma, substance-induced neovascularisation of the liver, excessive corranged anglogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic corruntation in peripheral limbs or in lungs, peritoneal cavity, to treat a corruntation minimation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a characterince of the sequence of the sequence of the second of the sequence of the sequence of the sequence of the sequ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel monomeric monocyclic peptide, used to interfere with angiogenesis, to Tymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```
whose 3-dimensional structure is modelled on the expose loop of human vector to receive the structure of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the service of the se
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             lymphangiogenesis, is produced by cyclizing a peptide loop fragment om an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel monomeric monocyclic peptide, used to interfere with angiogenesis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequence represents a monomeric monocyclic peptide of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat chronic inflammation, especially rheumatoid arthritis, psoriasis and
diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.
                                                                                                                                                                                                            /note= "This bond cyclises the peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cendron A;

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human very a wascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-concern of producing a monomeric monocyclic peptide by a measuring beta-concern distance of a growth factor protein and peptide loop fragment from an exposed loop of a growth factor protein and concern concerns of a growth factor protein and concerns of a growth factor protein and concerns of a growth factor protein and concerns of a growth factor protein and concerns of a growth factor protein and concerns of a growth at least one amino acid deleted prior concerns of a growth at least one amino acid deleted prior concerns of a growth at least one lymphangiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis, neovascularisation of the liver, excessive corporation and protein protein and protein and protein and condition are related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, nypertension induced neovascular sequelae, nypertension induced neovascular sequelae, or chronic liver in a mammal thas a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere continual and and bicyclic peptides are also used in combination with an anti-inflammatory agent, to treat a continual cinflammation with an anti-inflammatory agent, to treat a continual continual and and activity induced by vesc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1;

The condition is diabetic retinopathy, psoriasis, arthropathy, hemangiome, vascularised angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, hemangiome, vascularised angiogenesis, mead, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to incerfere with at least one biological activity induced by VEGF. Or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially cheumatoid arthritis, psoriasis and diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence represents Human VEGF-D (vascular endothelial growth factor) amino acids Val101-PRO186. The sequence is used in a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide to interfere with anglogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

The present sequence represents human vascular endothelial growth factor (VEGF) D. The specification describes a human cell line which stably expresses VEGF-D, or fragments/analogues having VEGF-D biological activity. VEGF-D antagonists, e.g. antisense nucleic acids or triplex activity. VEGF-D antagonists, e.g. antisense nucleic acids or triplex useful for the treatment or alleviation of malignant melanomas, tumours or psoriasis. Angiogenesis and lymphangiogenesis stimulating amounts of VEGF-D can be administered to enhance the acceptance and/or healing of skin grafts or to stimulate the healing of a surgical or traumatic wound to the skin. Lymphangiogenesis stimulating amounts of VEGF-D can be used to treat scleroderma. Vascularisation stimulating amounts of VEGF-D are used to treat scleroderma twoscularisation stimulating amounts of VEGF-D can be used to treat and/orbitic ectodermal dysplasia. VEGF-D antibodies are useful for detecting tumours expressing VEGF-D. Fully-processed VEGF-D can be used to stimulate at least one VEGF-D. Fully-processed VEGF-D can be used to stimulate at least one VEGF-D bioactivity chosen from endothelial cell proliferation, migration, survival and alfferentiation and lymphanglogenesis without inducing vascular

```
This sequence represents a 109 amino acid truncated human VEGF-D (vascular endothelial growth factor D), lacking both the N- and C- terminal regions. The invention relates to a monoclonal antibody, or tragments thereof, which is specifically reactive with the truncated human VEGF-D, and methods of preparing the antibody. The antibody of the invention interfers with the binding of VEGF D to the VEGF receptors these receptors and additionally is not reactive with VEGF-C. The these receptors and additionally is not reactive with VEGF-C. The cartibody may be used to treat disorders associated with vascular permeability, endothelial cell proliferation, angiogenesis, lymphangiogenesis, neovascularisation and endothelial cell grifferentiation, especially cancer, diabetic retinopathy, psoriasis, and in the heart and/or lung via modulation of vascular permeability. It may additionally be used to detect VEGF-D and may be used to image lymphatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel compositions comprising antibodies reactive to vascular endothelial growth factor-D, useful for treating, e.g. angiogenesis, lymphogiogenesis and neovascularization disorders.

This invention describes a novel single-chain dimeric polypeptide which binds to extracellular ligand-binding domain of vascular endothelial crowth factor (WEGF) type 2 receptor (KDR) or VEGF type 3 receptor (FIt-GF) and the polypeptide of the invention comprises two receptor-binding sites of which one is capable of binding to a ligand-binding domain of the receptor, and at least one monomer of the dimeric companies to the receptor, and at least one monomer of the dimeric polypeptide is derived from VEGF or VEGF-O, where the polypeptide of the invention is useful for preparing a medicament for preparing a useful for preparing a medicament for preventing a treasport. The polypeptide of the invention is useful for preparing a medicament for preventing a uncreased activation of a VEGF increased signal transduction from, or an increased activation of a VEGF type 2 or type 3 receptor e.g. for inhibiting angiogenesis or type 3 receptor e.g. for inhibiting angiogenesis or I will be modified and used in the construction of a VEGF-D monomer which can be modified and used in the construction of a VEGF-D assed KDR antagonist described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel single-chain dimeric polypeptide for inhibiting angiogenesis, binds to extracellular ligand-binding domain of vascular endothelial growth factor type 2/type 3 receptor but does not activate the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 9; Page 66; 71pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              06-APR-2001; 2001DK-00000578.

This invention describes a novel single-chain dimeric polypeptide which binds to extracellular ligand-binding domain of vascular endothelial cycowit factor (VEGF) type 2 receptor (RDR) or VEGF type 3 receptor (RDF) or VEGF type 3 receptor (RDF) or VEGF type 3 receptor (RDF) or VEGF type 3 receptor binding sites of which one is capable of binding to a ligand-binding domain of the receptor, and at least one monomer of the dimeric domain of the receptor, and at least one monomer of the dimeric comparison of the receptor, and at least one monomer of the dimeric comparison of the receptor, and at least one monomer of the dimeric comparison of the receptor, and at least or week-binding to a ligand-binding to comparison of the dimeric comparison of the receptor or polypeptide of the invention is useful for preparing a medicament for preventing or treating a disease or condition involving increased signal transduction from, or an increased activation of a vEGF comparison of a receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting anglogenesis or receptor e.g. for inhibiting
                                     Novel single-chain dimeric polypeptide for inhibiting angiogenesis, bi to extracellular ligand-binding domain of vascular endothelial growth factor type 2/type 3 receptor but does not activate the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse; vascular endothelial growth factor-D; VEGF-D; proliferation; lymph vessel endothelial cell; VEGF receptor-3; neoplastic disease; VEGF-PDGF homology domain; VHD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                         call bearing the receptor an active amount of a composition comprising and administering to a cell bearing the receptor an active amount of a composition comprising a cell bearing the receptor an active amount of a composition comprising a cell bearing the receptor an active amount of a composition comprising a polypeptide having at least 90%, preferably 95%, sequence identity with the mouse VEGF-D polypeptide ocits fragment. The polypeptide education of lymph vessel endothelial cells. The polypeptide is useful for activating proliferation and/or maintaining of only lymph vessel endothelial cells. The polypeptide is also useful in the diagnosis of a neoplastic disease. The polypeptide is also useful in the diagnosis of a neoplastic disease. The polypeptide is also useful in the diagnosis of a neoplastic disease. UseF-D has two isoforms. The longer amino acid sequence designated mVEGF-D in (AAM47930) has an insertion of five amino acids (AAM47932) after residue 30 and diverges in the C-terminal sequence after residue 317 compared to the shorter isoform mVEGF-D2, which diverges after residue 312. The present sequence is that of the VEGF-PDGF homology domain (VHD), comprising residues 92-201 of the full length mouse VEGF-D2 protien of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              o;

This site is the end of the protein sequence represented in SeQ ID 1 of the Sequence listing"
This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7% in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). AAYO8278-Y083101 are human growth factor protein fragments used in the method of the invention
                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel human endothelial growth factor polypeptide which has cytostatic activity. The polypeptide and its encoding polynucleotide are useful in the diagnosis, prevention, and treatment of cancer and other conditions or diseases involving

angiogenesis and cell proliferation. NVR may also be used to promote revascularisation following traumatic amputation and surgical reconstruction or added to a tissue culture to promote vasculogenesis in tissues for autologous or heterologous transplant. Antagonists or inhibitors of NVR may be used to suppress or prevent angiogenesis and
